Let's start with a macro definition:

```rust
macro_rules! stringify {
    ($($t:tt)*) => { /* compiler built-in */ }; 
}
```

- **Yields an expression of type `&'static str`**
- **No restrictions on the syntax used as parameters**
- **The expanded results may change in the future**

```rust
let one_plus_one = stringify!(1 + 2 + ...);
assert_eq!(one_plus_one, "1 + 2 + ...");
```
